

# **Assignment 01**

COMP 4981

Joshua Campbell

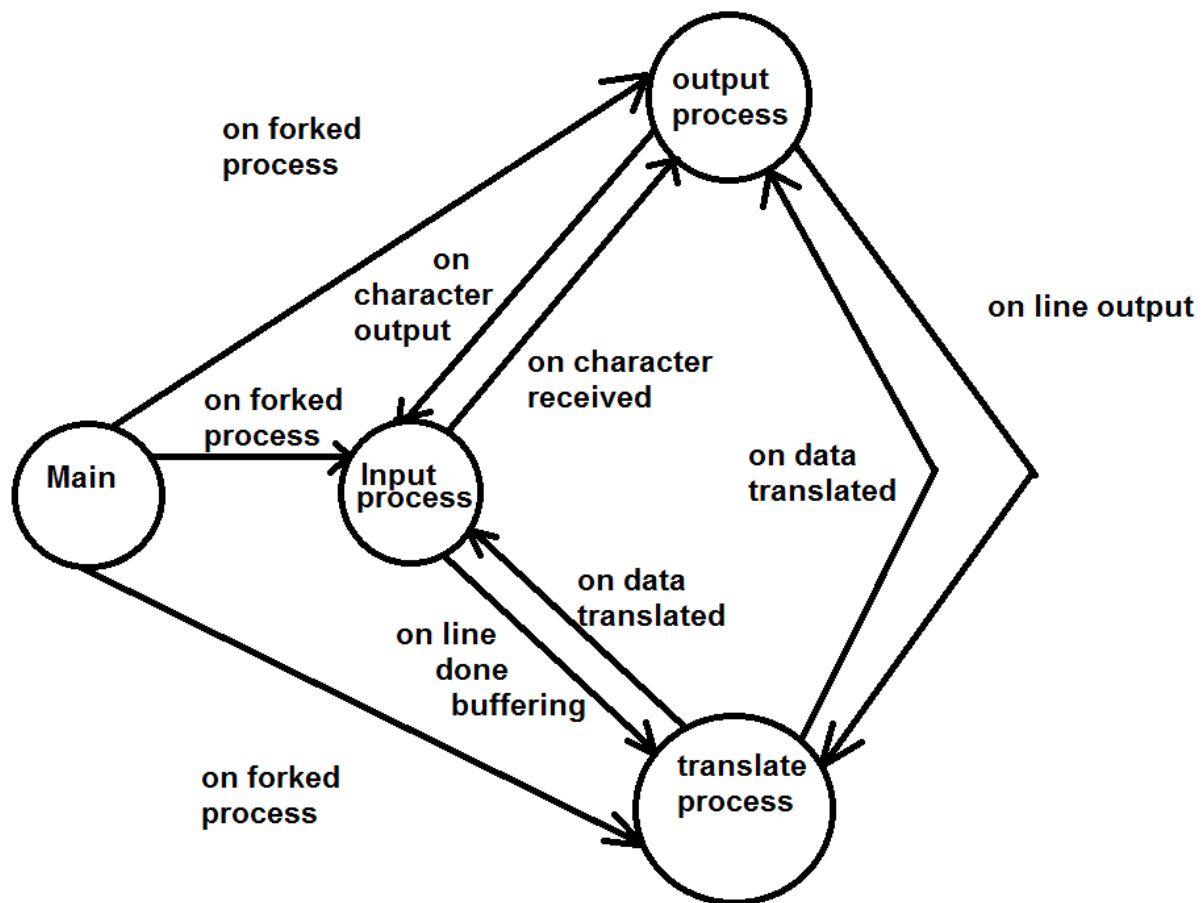

A00815859

January 22, 2014

### Summary:

This program allows the user to enter text. This text is displayed using an output process. This text will also be translated after a certain key is pressed. Translation includes things such as line kills, backspaces, and converting a's to z's and z's to a's. This translated data is displayed using the output process.

### StateDiagram:

## Pseudocode:

Function Main()

- turn off terminal processing

- Create Pipes 1, 2, and 3

- Fork processes

- set child process to Output

- Fork processes

- set child process to Translate

- set parent process to Input

End Function

Function Input(write pipe 1, write pipe 2)

- loop while not exit

- Get input from user

- check for special commands

- if command is end of line

- send buffer to Translate

- else

- stick input character in buffer

- write character to Output process

- End loop

End function

function Translate(read pipe 1, write pipe 2)

- loop while not exit

- Read data from Input buffer

- process data for line kills, backspaces, and translation characters

- send translated data to output

- end loop

end function

```

function Output(read pipe 1, read pipe 2)
    loop while not exit

        try to read data from input
        if read from input
            print character

        try to read data from translate
        if read from translate
            print translate data string

    end loop
end function

```

**Testcases:**

Test	Expected result	Pass/Fail
Ctrl-k exits the application	Pass	Pass; See figure 1
T terminates the program	Pass	Pass; See figure 2
Translate converts a's to z's and z's to a's	Pass	Pass; See figures 3a and 3b
Translate implements backspacing	Pass	Pass; See figures 4a and 4b
Translate implements line kill command	Pass	Pass; See figures 5a and 5b
Input text is displayed on type.	Pass	Pass; See figures 3a, 4a, and 5a
